# Lloyd's Register of Shipping,

High Close, Wokingham, Berks.

10th June, 1943.

Dear Sirs,

With reference to your report No.18422 on Richardson Westgarth's Engines No.2738, I have to acquaint you that the boilers were approved for the designed pressure of 480 lb. per sq. inch. and I shall be glad to learn why a pressure of 470 lb. is given in your report.

I have to add that the description of the safety valves is not quite clear, but it is concluded they are of the Improved High Lift type (as made by Messrs. Cockburns) and this should be confirmed.

It is stated that the fusion welding of the boiler drums has been executed by Messrs. Daniel Adamson & Co. and I shall be glad if you will forward the usual test certificates for this work if these documents have been received from the Manchester Surveyors.

I am, Dear Sirs,  
Yours faithfully,

The Surveyors,  
WEST HARTLEPOOL.

Clerk to the  
Classification Committee.
