

"DONGEDYK"

Rotterdam F.E. 40738

Part of No.3 lower hold, formerly served by the existing CO₂ plant is now served only by a two unit CCl₂F₂ constructed and installed under survey.

A performance test was carried out on the new installation, but the continuity had to be interrupted several times, and the result is therefore inconclusive.

From the information available however it is considered the new installation will be capable of the required duty, and be eligible for the temperature qualification:-

"to maintain temperature 25°F with sea temperature 86°F max."

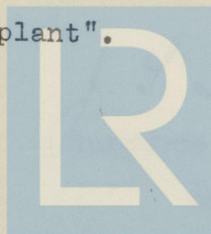

The installation is also eligible for ‡ .

eration to RB particular:-

The existing CO₂ plant remains as at present and so the number of chambers, but the cubic capacity served by this plant will be reduced. The Rotterdam Surveyors could be asked to obtain the figure of revised cubic capacity now served by the CO₂ plant.

The particulars of the CCl₂F₂ installation for separate entry in RB. are as given in attached slip, and should be shown as being for,

"No.3 lower hold plant".
