as per Rule.....
"VIC 2"

According to the approved pumping plans the bilge suctions in the machinery space consist of one $1\frac{1}{2}$ " suction direct to main engine bilge pump, one 2" bilge injection, one 2" branch suction to change over cock on donkey pump and one 2" ejector direct suction. This however is not quite clear from the report and it is submitted the Surveyors be asked to confirm the particulars.

They should also confirm that neither vessel is fitted with an oil gland.
