22nd July, 1930.

Dear Mr. Costantini,

With reference to the enquiry contained in your letter of the 18th instant regarding the freeboard report for Cantiere Navale Triestino's No. 221 ship, the depth of the hold used for determining the coefficient of fineness should be measured to the upper edge of the straight beam at centre line, without any correction on account of Rule camber.

With kind regards,  
Yours faithfully,

M. Costantini, Esq.,

TRIESTE.
