found

the work of doing the exhaust part  
 of the engine part in the H.C.M.  
 and the cylinder broken and the forward  
 crank shaft broken; the right half of the  
 crank shaft was a head screw in it and  
 the other half of it was in the  
 crank pin at the after end of  
 the crank and a pin extending

the length of one blade broken off  
 the other.

It was suggested recommended that the  
 crank pin be renewed and the crank  
 pin be renewed and the crank pin be  
 renewed and the crank pin be renewed so  
 that it appears all of it is ahead  
 of the crank pin and the crank pin be

that the forward length of crank  
 shaft be renewed being coupled to the after  
 length and both bedded together; and that  
 the pin be renewed.

It was recommended of the High Pressure valve  
 to be renewed in effecting the repairs.

The top end of the spindle  
 was broken and it was recommended that

the whole to be done to place the  
 valve in a good and efficient  
 position as before the damage  
 occurred.
