

S. S. Armstrong

It is submitted that the Sunderland Surveyors should explain for the information of the Committee whether the Shaft Tunnel is fitted in the Floor in way of the After Well, thus dividing the Well transversely; and if so to what height water would rise before a pump at this point would be effective in clearing both sides of water. Also how many Steam Collectors having a double bottom in Fore and After Holds similar to this vessel, have five hand pumps fitted, in addition to an Engine pump in the Fore and After Holds, as suggested in this case.
