

FEEs for the SURVEY of FERRO-CONCRETE Vessels  
While Building.

-----

It is submitted that the construction of FERRO-  
CONCRETE Vessels necessitates the more frequent attendance  
of Surveyors than in the case of Steel Vessels, as unless  
the Surveyors are present when the Concrete is being placed,  
it is not practicable for them to know that the work has been  
satisfactorily done or that the steel reinforcement is in its  
proper position.

This would apply to all vessels of this method of  
construction, whether they be Sister Ships to others built  
before or not.

The fees charged for the survey of FERRO-CONCRETE  
Vessels are consistent with the services rendered by the  
Surveyors, not only at the building yard during the course  
of construction, but in connection with the examination of  
plans which is also of a much more extensive character than  
in the case of Steel Vessels.

It is not considered that any reduction should be  
made in the fees charged for the survey of these vessels,  
which are three times the normal fees on the hull and the  
ordinary classification fees for machinery, plus travelling  
expenses.
