

ARD REPORT on the

M. S. "Gretafield".

It is submitted the Surveyor be requested to forward an estimate of the tonnage between the extended upper surface of the bottom longitudinal and the double bottom aft for the necessary correction of the tonnage coefficient. They should also forward an estimate of the under-deck tonnage, calculated to a standard depth of frame ring 8" and height of floors, viz 42", assuming the ship to be fitted with the usual thickness of sparring and ceiling and the usual rise of floor, so that the bottom breadth in the area for tonnage will be about 12 inches.
