

VERY URGENT.

Messrs. Cochran & Co's Boiler No. 9412.

The Makers state that the above boiler has not been constructed under special survey, but has been built of materials tested by the Society's Surveyors. The Builders wish to know whether the Society's Special Certificate can be issued in this case for the intended working pressure of 100 lb. per square inch.

It is submitted that provided the boiler be examined throughout, the scantlings be in accordance with the plan, and the boiler otherwise be in good order and be found tight and satisfactory when tested by hydraulic pressure to 200 lb. persquare inch, the same might be accepted for the intended W.P. of 100 lb. per sq. inch, and a certificate issued on Form (Rpt. 10) in accprdance with previous practice.

It is further submitted that the Glasgow Surveyor should be advised by wire as requested by the Makers, as follows-

"Cochran boiler 9412 accepted for working pressure of
"100 lb. subject to usual conditions of examination
"and hydraulic testing".

The Glasgow Office should also be advised.
